

MY EXPERIENCE IN KOREA

Korean Pathway to achieve a Productive Waste Management System

Waste Management of a country is one of the key - sectors that reflects its development and discipline to the out-side world. Through “Reducing, Re-using and recycling” is considered as a policy jargon in waste management, extent of its practicing is different from country to country. Most of the developed and developing countries tend to use incineration and land filling as a solution for the waste management ignoring the responsibility of the waste generator to segregate their waste which can be used as a resource, thereafter. This will reduce the exploitation of limited resources and make them available for the future generation.

Volume Based Waste Bags

Compost Plant

In early 1970's Korea was a poor country compared to many counties in the region. But, it is amassing that Korea reaches to a very high degree of development within two to three decades, without compromising the environment. This is a good example for a country like ours. As a natural resources poor country, Korea promotes resource recirculation through more use of recycled resources. Ministry of Environment which was established as a non-Cabinet Ministry in 1990 which was as a Cabinet Ministry in 1995 is playing a major role in this sector is also another good example for us.
